From broker PDF to colleagues' calendars, verified by the coordinator

Claude reads the schedule; CR checks every meeting against its source row; verifying puts it on the right calendars.

WHERE IT RUNS

- **Locally** on the Mac at 127.0.0.1: one user, no login.
- **Hosted demo** on Cloudflare Containers behind a password-gated Worker. Data resets when it sleeps, so sample data only.

PROOF POINTS

100%

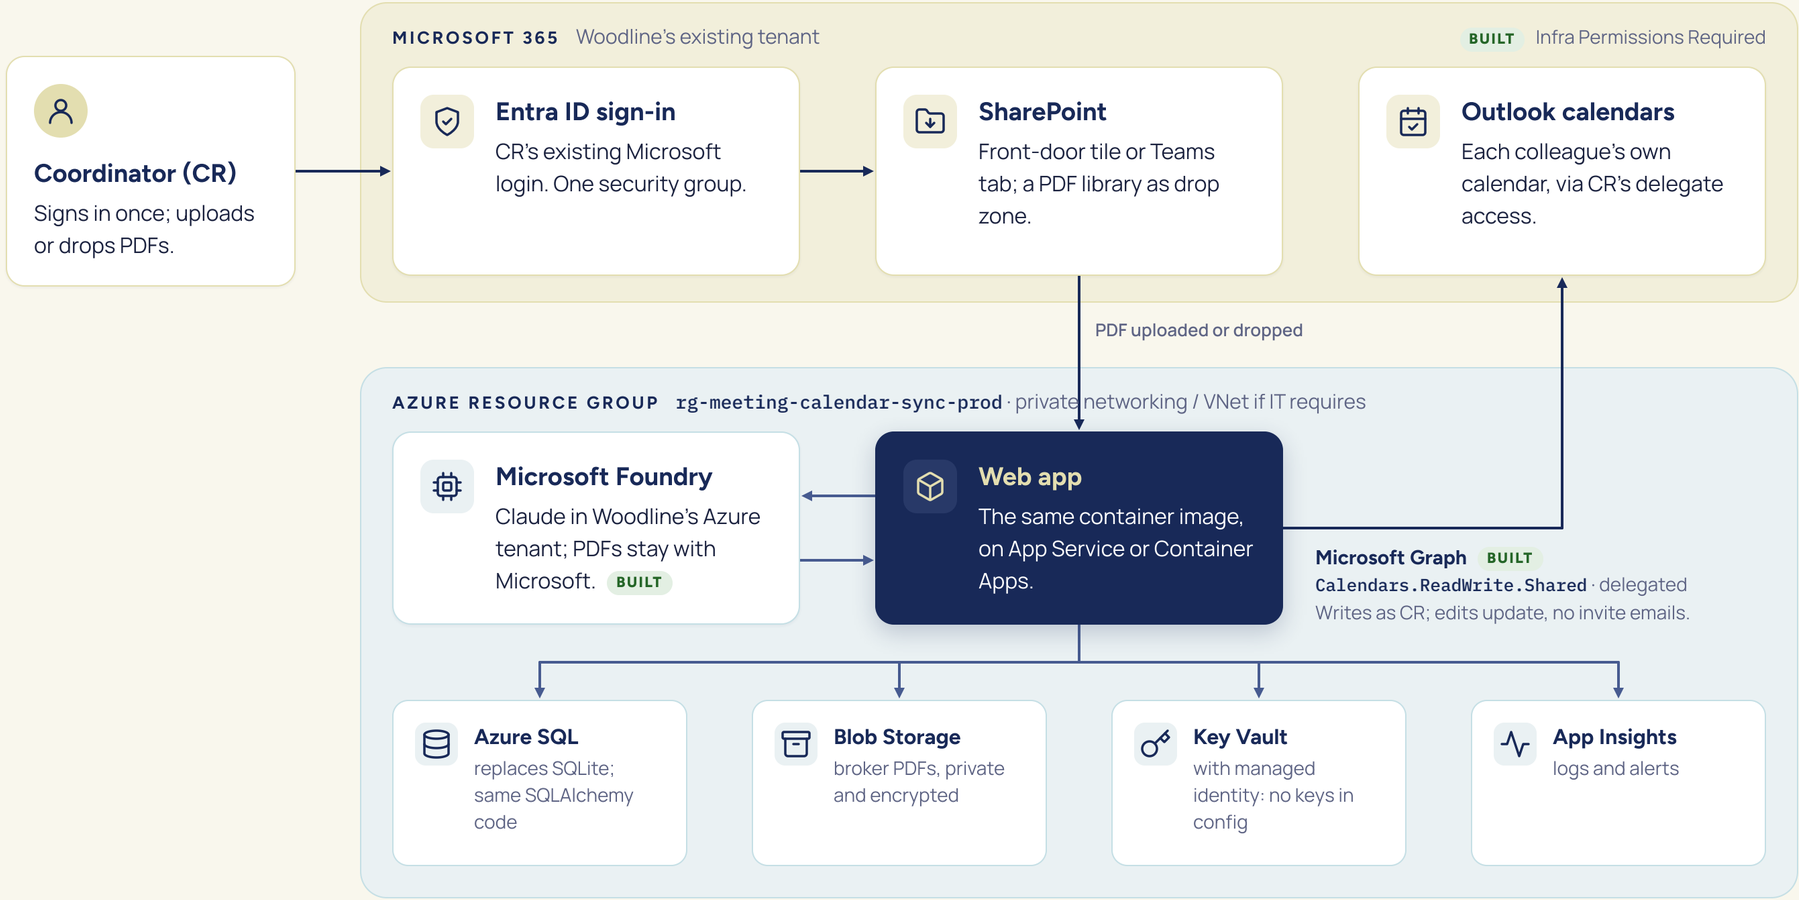

field accuracy from live Claude on 12 synthetic schedules (147 meetings)

361

automated tests: 307 backend, 49 frontend, 5 hosting

Same app, inside Woodline's Microsoft 365 and Azure

Same code and container image. Sign-in, files, AI and calendars all stay inside Woodline's Microsoft tenant.

WHAT IT NEEDS TO APPROVE

1. An **Entra app registration**, with admin consent for `Calendars.ReadWrite.Shared` (delegated).
2. A **Claude deployment** in Microsoft Foundry.
3. A **resource group**: App Service or Container Apps, SQL, Storage and Key Vault.
4. *Optional:* **SharePoint library access** (`Sites.Selected`) for the drop zone.

MIGRATION FROM THE PROTOTYPE

Same image. Two settings switch on the parts already built:

```
MCS_EXTRACTOR=foundry
MCS_CALENDAR_SINK=graph
```

Still to wire: Azure SQL and Blob for storage, and Entra sign-in via App Service's built-in auth.
