MEETING CALENDAR SYNC · REQUESTS FOR WOODLINE IT

What we need from IT to make it work

Start with section 1. One app registration is enough for verified meetings to appear in colleagues' Outlook calendars automatically, with no file downloads and no Azure spend. Sections 2–6 move the whole app into Woodline's Microsoft 365 and Azure.

What is Microsoft Graph? Microsoft's official interface for apps to work with Microsoft 365 data, including Outlook calendars (Zoom and Calendly use it). Here the app uses one **delegated** permission: it can only do what the coordinator (CR) can already do in Outlook, and only while CR is signed in. It never reads email and never touches calendars that aren't shared with CR.

#	ASK	EXACTLY WHAT TO SET UP	WHY IT'S NEEDED	WHO
1 · Automatic Outlook calendars	Ask first: no Azure resources or spend			
1	**Entra app registration**	Name "Meeting Calendar Sync", single tenant. Microsoft Graph **delegated** permission `Calendars.ReadWrite.Shared`. Authentication: "Allow public client flows" = Yes (device-code sign-in). Send back the Application (client) ID and Directory (tenant) ID.	Writes each verified meeting straight into the right colleagues' Outlook calendars as CR. Edits update the event; removed meetings are deleted. No invite emails. BUILT	Entra admin
2	**Admin consent**	Grant consent for that one permission, if staff can't approve apps themselves.	Otherwise CR's sign-in stops at "Need admin approval".	Entra admin
3	**Conditional Access check**	Allow device-code sign-in for this app, and sign-ins from where the app runs, or tell us it's blocked and we'll switch the app to a standard redirect sign-in.	Many tenants block device-code sign-in by policy.	Identity / security
4	**Calendar delegation**	Confirm colleagues' mailboxes are in Exchange Online and CR has **Editor** delegate access to each of the 5–6 calendars.	Graph honours the same delegation Outlook uses; without Editor rights the write fails.	Exchange admin

#	ASK	EXACTLY WHAT TO SET UP	WHY IT'S NEEDED	WHO
2 · Claude through Microsoft Foundry				
5	**Foundry project + Claude deployment**	In Woodline's Azure subscription. Choose the **"Hosted on Azure"** option (not "Hosted on Anthropic infrastructure") and the US data zone; enough quota; permission to buy through Azure Marketplace. Send back the endpoint and deployment name.	Broker PDFs are read by Claude on Azure infrastructure, under Woodline's Azure agreement and controls. BUILT	Azure admin / AI lead
3 · Hosting inside Woodline's Azure				
6	**Resource group**	`rg-meeting-calendar-sync-prod`, with Contributor for whoever deploys.	One place to run, bill, audit and remove the app.	Azure admin
7	**Container hosting**	Azure Container Apps (or App Service for containers) and an Azure Container Registry.	Runs the same container image as the prototype.	Azure admin
8	**Azure SQL Database**	A small single database.	Replaces the prototype's SQLite file.	Azure admin / DBA
9	**Blob Storage**	A storage account with a private container.	Keeps the uploaded broker PDFs, encrypted at rest.	Azure admin
10	**Key Vault + managed identity**	Key Vault; the app's managed identity gets Key Vault Secrets User, Storage Blob Data Contributor and SQL access.	No keys or passwords in config. Granting roles needs Owner or User Access Administrator.	Azure admin
11	**Application Insights**	With a Log Analytics workspace.	Logs, errors and alerts.	Azure admin
12	**Private networking**	VNet integration / private endpoints for SQL, Storage and Key Vault, if Woodline policy requires it.	Keeps traffic off the public internet.	Network team
13	**Address + certificate**	A DNS name such as `calendar.woodlinepartners.com` with a managed TLS certificate.	An official Woodline address instead of the demo domain.	DNS admin
14	**Budget**	Monthly approval for items 5–13 (small tiers).	Running costs.	IT lead / finance

#	ASK	EXACTLY WHAT TO SET UP	WHY IT'S NEEDED	WHO
4 · Signing in to the app				
15	**Microsoft sign-in for the site**	The hosting service's built-in authentication with Entra ID; "Assignment required" = Yes; a security group such as "Calendar coordinators".	Same login as Outlook, SharePoint and Teams; only coordinators get in.	Entra admin
5 · SharePoint and Teams Optional				
16	**SharePoint front door**	A link or tile on the team's SharePoint site.	One-click access from where the team already works.	Site owner (often not IT)
17	**SharePoint drop zone**	A "Broker schedules" document library; `Sites.Selected` granted to the app for that one site only; a trigger for new files (Power Automate flow or Graph change notifications, to agree with IT).	Dropping a PDF starts extraction; a revised PDF is detected as an update.	SharePoint admin
18	**Teams tab**	Allow adding the app as a custom Teams tab.	Open it from Teams.	Teams admin
6 · Approvals and ownership				
19	**Compliance sign-off**	Processing broker schedules with Claude via Foundry; where files are stored; how long they're kept.	Schedules show which companies Woodline meets, and when.	Compliance
20	**Security review**	Review of the app, its permissions and its access.	Standard for a new internal app.	Security
21	**Code location**	A private Woodline repository (GitHub organisation or Azure DevOps).	The prototype's code is on a personal public repo today.	IT / engineering
22	**Owner and support**	A named business owner and IT contact.	Who approves changes and handles problems.	IT lead

BUILT already working in the prototype; it needs only the IT setup in that row. The Graph route has been tested against a mock only, so its first real run will be with Woodline's registration. · Prepared by Isaac Xie · 18 October 2026 · Unofficial prototype proposal
