MEETING CALENDAR SYNC · REQUESTS FOR WOODLINE IT

Six asks to run it on Woodline's Microsoft stack

Ask 1 on its own makes the tool useful right away: verified meetings appear in colleagues' Outlook calendars automatically, with no file downloads and no Azure spend. Asks 2–6 move the whole app into Woodline's Microsoft 365 and Azure.

#	ASK	WHAT IT COVERS	WHY	WHO
1	**Outlook calendar access** START HERE	An Entra app registration with one **delegated** Microsoft Graph permission, `Calendars.ReadWrite.Shared`; admin consent for it; its sign-in allowed by Conditional Access. Confirm the coordinator (CR) has Editor access to the colleagues' calendars.	Each verified meeting goes straight into the right colleagues' calendars as CR. Edits update it, removals delete it, no invite emails.	Entra / Exchange admin
2	**Claude via Microsoft Foundry**	A Claude deployment in Woodline's Azure subscription, using the **"Hosted on Azure"** option and the US data zone.	Broker PDFs are read by Claude on Azure infrastructure, under Woodline's Azure agreement.	Azure admin
3	**An Azure resource group for the app**	Container hosting, a small Azure SQL database, private Blob Storage, Key Vault and Application Insights. IT chooses networking, the web address and the budget.	Runs the app inside Woodline's infrastructure instead of the external demo.	Azure admin
4	**Microsoft sign-in for the app** Can reuse ask 1's registration	Entra sign-in on the site, limited to a security group such as "Calendar coordinators".	Same login as Outlook, SharePoint and Teams; only coordinators get in.	Entra admin
5	**SharePoint** Optional	A tile on the team's SharePoint site, plus a "Broker schedules" library the app may read (`Sites.Selected`, that one site only).	Open the tool from SharePoint; dropping a PDF in the library starts extraction.	SharePoint admin
6	**Compliance and security sign-off**	Approval to process broker schedules with Claude; where files are stored and for how long; a private Woodline code repository; a named owner.	Schedules show which companies Woodline meets, and when.	Compliance / security

What is Microsoft Graph? Microsoft's official interface for apps to work with Microsoft 365 data such as Outlook calendars (Zoom and Calendly use it). The permission in ask 1 is **delegated**: the app can only do what CR can already do in Outlook, and only while CR is signed in. It never reads email and can't touch calendars that aren't shared with CR.

Foundry and Graph are already built in the prototype (Graph tested against a mock only). Item-by-item detail on request. · Prepared by Isaac Xie · 18 Oct 2026 · Unofficial prototype proposal
